

MONTHLY NOTICES

OF THE

ROYAL ASTRONOMICAL SOCIETY.

VOL. XXXI.

March 10, 1871.

No. 5.

WILLIAM LASSELL, Esq., President, in the Chair.

F. W. Levander, Esq., University College, London ;
Wm. Mann, Esq., Royal Observatory, Cape of Good Hope ; and
E. W. Snell, Esq., Kidbrook House Academy, Blackheath ;

were balloted for and duly elected Fellows of the Society.

On the Total Eclipse of the Sun, on December the 11th, 1871, as visible in the Madras Presidency. By C. Ragoonathachary, First Assistant, Madras Observatory.

(Communicated by N. R. Pogson, Esq., Government Astronomer.)

Herewith I have the honour to submit to the Royal Astronomical Society the results of my calculations with reference to the Total Eclipse of the Sun, which will take place on the 11th December, 1871. Though the duration of this eclipse will be considerably shorter than that of 1868, yet I presume that so favourable an opportunity will not be suffered to pass away without adequate preparation for due record of all the important and interesting phenomena which present themselves for investigation on such occasions.

The central line of the eclipse will first meet the Earth's surface in the Arabian Sea, and entering on the western coast of India, will pass right across one of the most important parts of

Hindustan, in a S.E. by E. direction. In this part of the Peninsula the Sun will be about 20° above the horizon when totally obscured. The duration of totality will be two minutes and a quarter, and the breadth of the shadow about seventy miles. On leaving the eastern coast of the Madras Presidency, the central line will cross Palk's Straits, passing about ten miles S.W. of the island Jaffnapatam, and over the northern part of Ceylon, where the small towns of Moeletivoe and Kokelay will lie near the central line; and also the well-known naval station of Trincomalee, which will be about fifteen miles S.W. of the line. Continuing its course over the Bay of Bengal, the shadow will cross the S.E. point of Sumatra, and will touch the south-western coast of Java, where Batavia, the capital, will lie nearly sixty miles N.E. of the central line; and two other smaller towns, Chidamar and Nagara, will also be very near the middle of the shadow path. In the Admiralty Gulf, on the N.W. coast of Australia, the eclipsed Sun will be only ten degrees past the meridian, and not far from the zenith; in consequence of which the totality will last $4^m 18^s$, or only four seconds less than the time of greatest duration. Lastly, passing through the most barren and uninhabited portion of Australia, crossing the Gulf of Carpentaria and the York Peninsula, the shadow will ultimately leave the Earth's surface in the Pacific Ocean.

The following are the geographical positions of the central and limiting lines of the shadow, together with other details of calculation, applicable to Southern India, for intervals of fifteen seconds of Greenwich mean time. They are almost identical with the values obtained by interpolation, from the similar table furnished on page 441 of the *Nautical Almanac* for the year 1871.

Greenwich M.T. h m s	Northern Limit.		Central Line.		Southern Limit.	
	North Latitude.	East Longitude.	North Latitude.	East Longitude.	North Latitude.	East Longitude.

The calculation of the different phenomena of the eclipse was made accurately for Avenasi, a railway station situated midway between the two coasts, on the central line; and for the Madras and Trevandrum Observatories, which lie respectively at some distance north and south of the shadow. The usual equations of reduction applicable to places near the above three points are also given; in which l denotes geocentric north latitude, λ_{Δ} east longitude for Madras, and t the Madras mean time of each phenomenon. The results of the calculations are:—

For Madras.

Lat. $13^{\circ} 4' 1''$ N.; Long. $80^{\circ} 14' 3''$ E. of Greenwich.

Madras Mean Time.			
	d	h	m
Time of first contact	Dec. 11	18	47 37

I have adhered throughout to the method of Mr. Woolhouse, adopting the positions of the Sun and Moon as given in the *Nautical Almanac*. Subjoined are the approximate positions of bright stars and planets most conspicuous to the naked eye during the time of totality, referred to the zenith of Avenasi.

	Zenith Distance. °	Azimuth		Zenith Distance. °	Azimuth
1 Castor	78	N 59° W	17	β Centauri	S 8° E
2 Procyon	80	N 86° W	18	Venus	S 39° E
3 Pollux	76	N 63° W	19	Arcturus	N 60° E
4 Jupiter	71	N 71° W	20	α ² Centauri	S 12° E
5 α Hydræ	58	S 72° W	21	ε Bootis	N 52° E
6 Regulus	44	N 84° W	22	α Libræ	S 45° E
7 γ ¹ Leonis	41	N 71° W	23	β Urs. Min.	N 8° E
8 γ Argus	76	S 18° W	24	β Libræ	S 59° E
9 α Urs. Maj.	56	N 16° W	25	α Cor. Bor.	N 62° E
10 δ Leonis	29	N 66° W	26	α Serpentis	S 87° E
11 β Leonis	19	N 76° W	27	β Scorpii	S 56° E
12 γ Urs. Maj.	45	N 14° W	28	Antares	S 52° E
13 α ¹ Crucis	74	S 5° W	29	α Herculis	N 81° E
14 Polaris	80	0°	30	Sun	S 61° E
15 Spica	23	S 13° E	31	α Ophiuchi	N 80° E
16 γ Urs. Maj.	40	N 11° E	32	γ Draconis	N 39° E

To facilitate the independent determination of the longitude of any place of observation, I have calculated such occultations of stars by the Moon as will occur about a week before or after the day of the eclipse. It unfortunately happens, however, that during this time only one bright star lies within the limits of the Moon's path, and so I have been obliged to rest contented with much smaller stars than are usually selected for such a purpose. The computations have been made for Madras and Avenasi, by an approximate method, which usually gives the times within a minute, and the angular points of contact within a degree, of those found by a more refined process. The times at Avenasi will differ but slightly from those for any other spot along the shadow line, in its course across India.

Occultations as seen at Madras.

Date.	Stars.	Mag.	Madras Mean T.	Disappearance.			Madras Mean T.	Reappearance.		
				Angle from N. Point.	Vertex.	Angle from N. Point.		Vertex.		
Dec. 3	η Leonis	3 $\frac{1}{2}$	14 35	128° E	143° Right	16 8	84° W	9° Right

The general circumstances under which the Total Eclipse of Dec. 11th, 1871, will occur, are singularly and unusually favourable, the greater portion of the shadow-path being easily accessible by means of the railway and good public roads; while a well-managed line of telegraph will afford facilities for that most incomparable means of fixing the longitude of the place of observation with regard to Madras. The favourite Sanitarium of the Presidency, Ootacamund, will doubtless be selected by many persons as a convenient and familiar station from which to observe the eclipse; as also the hilly region of Wynnaad, in the Malabar district, where numerous European gentlemen reside for the purpose of superintending their coffee-plantations. The lofty peak of Dodabetta, the highest point of the Neilgherries, 8640 feet above sea-level, would agreeably to the often-repeated and enlightened view of Prof. C. Piazzi Smyth, the Astronomer Royal for Scotland, offer a grand opportunity for spectroscopic observations, in an atmosphere of small density and free from all the impurities which abound at lower levels, but unfortunately haze and mist are very prevalent on the hill-ranges in the month of December. The weather is in general fine elsewhere about that time along the shadow-path, but more especially so eastward of the Neilgherry hills than towards the Malabar coast.

Madras,
5th December, 1870.
